A buffer is an aqueous solution used to keep the pH of a solution nearly constant. A buffer consists of a weak acid and its conjugate base or a weak base and its conjugate acid. Buffer capacity is the amount of acid or base that can be added before the pH of a buffer changes. An example of a buffer solution is bicarbonate

in blood, which maintains the body's internal pH.

## **Buffer Definition - Chemistry and Biology**

A buffer solution (more precisely, pH buffer or hydrogen ion buffer) is an aqueous solution consisting of a mixture of a weak acid and its conjugate base, or vice versa. Its pH changes very little when a small amount of strong acid

# Where To Download Buffer Solution Definition

or base is added to it. Buffer solutions are used as a means of keeping pH at a nearly constant value in a wide variety of chemical applications.

## **Buffer solution - Wikipedia**

Buffer, in chemistry, solution usually containing an acid and a base, or a salt, that tends to maintain a constant hydrogen ion concentration. Ions are

atoms or molecules that have lost or gained one or more electrons. An example of a common buffer is a solution of acetic acid ( $\text{CH}_3\text{COOH}$ ) and sodium acetate. In water solution, sodium acetate is completely dissociated into sodium ( $\text{Na}^+$ ) and acetate ( $\text{CH}_3\text{COO}^-$ ) ions.

## **Buffer | chemistry | Britannica**

A buffer solution refers

to an aqueous solution.

Furthermore, it consists of a mixture of a weak acid and its conjugate base or vice-versa. This solution is quite important in the field of chemistry. You can explore more about buffer solutions here.

## **What is Buffer Solution? - Definition, Application, Properties**

# Where To Download Buffer Solution Definition Chemistry

Definition of Buffers. A solution which tends to resist changes in pH is called buffer solution. Buffer solutions are the solutions that resist changes in the concentration of hydronium ion and hydroxide ion (and therefore pH) when adding low amounts of acid or base, or when diluting the solution.

## **Guidance Corner**

Buffers are solutions that resist a change in pH on dilution or on addition of small amounts of acids or alkali. A lot of biological and chemical reactions need a constant pH for the reaction to proceed. Buffers are extremely useful in these systems to maintain the pH at a constant value. This does not mean that the pH of buffers does not

in pH when small quantities of an acid or an alkali are added to it. Acidic buffer solutions: An acidic buffer solution is simply one which has a pH less than 7. Acidic buffer solutions are commonly made from a weak acid and one of its salts - often a sodium salt.

## **7. Buffer Solutions - Chemistry LibreTexts**

# Where To Download Buffer Solution Definition

A buffer is an aqueous solution that has a highly stable pH. A buffering agent is a weak acid or weak base that helps maintain the pH of an aqueous solution after adding another acid or base. If you add an acid or a base to a buffered solution, its pH will not change significantly.

## **What Is a Buffer and How Does It Work?**

# Where To Download Buffer Solution Definition

A buffer is a solution that can resist pH change upon the addition of an acidic or basic components. It is able to neutralize small amounts of added acid or base, thus maintaining the pH of the solution relatively stable. This is important for processes and/or reactions which require specific and stable pH ranges.

The buffer capacity is a quantity in resisting the pH change at the time of addition of an acid or base. The higher the acid concentration of the buffer then the buffer capacity will be higher as well. The buffer capacity can also be defined as the amount of mole of strong base needed to change the pH of 1 L of solution by 1 pH of unit.
