Nonlinear Systems and Control | Spring 2019 Preface The objective of this course is to provide the students with an introduction to nonlinear systems and the various methods of controlling them. Part I of the course introduces the students to the notions of nonlinearities and the various ways of analyzing existence and uniqueness of solutions to

Phone: 650.723.3389. Course Description. This course is a second graduate course in nonlinear systems, organized into three parts as described below. The course is structured to emphasize some of the recent research activity in nonlinear analysis and control. We will use concepts from differential geometry, however the course is self contained in that this mathematics will be taught as part of the course.

Nonlinear control theory is the area of control theory which deals with systems that are nonlinear, time-variant, or both. Control theory is an interdisciplinary branch of engineering and mathematics that is concerned with the behavior of dynamical systems with inputs, and how to modify the output by changes in the input using feedback, feedforward, or signal filtering. The system to be controlled is called the "plant". One way to make the output of a system follow a desired reference signal is

For a first course on nonlinear control that can be taught in one semester. This book emerges from the award-winning book, Nonlinear Systems, but has a distinctly different mission and organization. While Nonlinear Systems was intended as a reference and a text on nonlinear system analysis and its application to control, this streamlined book is intended as a text for a first course on nonlinear control.

First, we cover stability definitions of nonlinear dynamical systems, covering the difference between local and global stability. We then analyze and apply Lyapunov's Direct Method to prove these stability properties, and develop a nonlinear 3-axis attitude pointing control law using Lyapunov theory.
