Look at the gas, checking for water and impurities.

How to Troubleshoot a Small Gas Engine That Won't Start ...

Vapor lock is a problem caused by liquid fuel changing state to gas while still in the fuel delivery system of gasoline-fueled internal combustion engines. This disrupts the operation of the fuel pump, causing loss of feed pressure to the carburetor or fuel injection system, resulting in transient loss of power or complete stalling. Restarting the engine from this state may be difficult.

Diagnosis: If the engine fires up and immediately dies, then you probably have a problem with your carburetor. The engine starts because it can burn the fuel burns off. This means that carburetor is not properly delivering fuel to the engine.
